Documenting ABAP Code

We are trying to document some coding using ASCIIDoctor.

Code from remote

Including all the source from one code somewhere else in the public Github space.

```
interface ZIF_ACMP_COMMAND
  public .

  methods EXEC
    returning
      value(DONE) type ABAP_BOOL .
  methods UCOMM
    importing
      !I_UCOMM type SYST_UCOMM optional
    returning
      value(RESULT) type SYST_UCOMM .
  methods DEF
    importing
      !I_DEF type ref to ZIF_MYDD_CMDDEFINITION optional
    returning
      value(RESULT) type ref to ZIF_MYDD_CMDDEFINITION .
endinterface.
```

including just the first two lines from the same source.

```
interface ZIF_ACMP_COMMAND
  public .
```

There are more code lines. But we focus on these for now.

Subsection in separate file

This section is stored in a different file in the source directory. So this should be found by the generator.

The parent document just references this file by using test.adoc.

new subsection

This is a new paragraph. And the rest of the text has been added in the github editor.
